BooneMap Applications

Project Summary

12.10.13 - The first BooneMap desktop application was developed and customized for the Boone County GIS member agencies in 2000. The goal was to replace the functionality of ArcView using MapObjects 2.0. These mapping software components provided the basic functionality at a much lower cost. The basic functionality included: symbolizing themes, searching for map features, identifying features, querying features, and printing maps. In 2013, Boone County GIS introduced an internet mapping version called BooneMap Online.

Today, Boone County GIS offers two (2) custom applications to its member agencies: 1) a desktop application known as BooneMap LT and 2) an internet mapping application known as [BooneMap Online](#). These two (2) applications are responsible for getting Boone County GIS into the hands of over 750 GIS users across Northern Kentucky.

The customized desktop applications have an application life-cycle that involves three (3) distinct phases. Each application starts out in the *Full Development* phase and then moves to the *Support Only* phase, before finishing its life-cycle in the *Retired Version* phase. Currently, BooneMap LT has had nine (9) versions and sixteen (16) major releases since May 2005. BooneMap Classic had five (5) versions and seven (7) major releases before being retired in December 2008. It was first released in September 2002.
